For SDR, November 3, 2016
2016 Central Italy Earthquakes

- Sequence of earthquakes began in August, 2016.
- August 24 M6.2 killed ~300, severe damage to Amatrice.
- Vigorous aftershock sequence.
- October 26 M6.1 and October 30 M6.6 caused further widespread damage.
- Aftershocks continue.
- Faulting involves extensional slip on known faults of the central Apennines.
- Earthquakes are striking a high-hazard area with long history of damaging earthquakes.
2016 Central Italy Earthquakes

Pescara del Tronto, damage from August 2016 earthquake
2016 Central Italy Earthquakes

• Earthquakes have caused severe damage to unreinforced masonry structures, including many dating from ~1200 to ~1970.
• New and retrofitted structures have generally fared well.
• Following the deadly M6.2 earthquake of August 24, residents have avoided damaged structures and “red zones”, and have temporarily abandoned weak structures following larger earthquakes.
Italy’s seismic hazard map

- Probabilistic seismic hazard map updated in 2006.
- Provides basis for seismic provisions in Italy’s building code.
- Densely populated country has innumerable vulnerable structures, many with historic significance.
Italy’s seismic hazard map

• Probabilistic seismic hazard map updated in 2006.
• Provides basis for seismic provisions in Italy’s building code.
• Densely populated country has innumerable vulnerable structures, many with historic significance.
Central Italy earthquakes

- Colored lines show active faults of central Italy.
- Three sub-parallel belts of extensional faults follow the Apennines.
- Used in INGV seismic hazard model.
Central Italy earthquakes

- Map shows earthquakes $M \geq 4.5$ since 1915.
- Earthquakes up to $M \sim 6.7$ have broken numerous segments of the yellow and red fault zones.
- Complex geological structure and youthful faults are thought to prevent the through-going rupture that would create $M 7+$ quakes.
Central Italy Earthquakes

Monte Vettore and the Castellucio valley, east of Norcia

Central Italy Earthquakes

- Fault offset from M6.6 October 30 earthquake.
Central Italy Earthquakes

- Dots are reports of impacts from earthquakes near Norcia since 1328.
- Active tectonic deformation causes slip on a complex network of faults (black lines).

Figure from Galli et al., *Tectonophysics*, 2005
Central Italy earthquakes

- M5.9 Norcia earthquake of September 1979.
- Five deaths and extensive damage.
Central Italy earthquakes

- M5.7 earthquake of April 1984.
- Damage in Assisi, Norcia and Gubbio.
- Many injuries.
Central Italy earthquakes

- Many earthquakes in 1997, including M6.0 near Assisi.
- Caused ten deaths and widespread damage.
- Basilica of St. Francis was partially collapsed.
Central Italy earthquakes

- M6.3 L’Aquila earthquake.
- Caused ~300 deaths.
- Led to indictment of scientists of the Grand Risks Commission and an official from the Department of Civil Protection, for insufficient communication of earthquake risks.
Central Italy earthquakes

- Earthquakes of August 2016.
- Included M6.2 Amatrice earthquake, which caused ~300 deaths and widespread structural damage.
- Resulting from slip of Monte Vettore (red) fault segments.

Earthquake data from INGV
Central Italy earthquakes

- Earthquakes of August through October 2016.
- October sequence included damaging earthquakes on October 26 and 30.
- Resulting from northward propagation of slip on Vettore-Bove (red) fault segments.
Central Italy earthquakes

- USGS ShakeMap for M6.6 earthquake of October 30.
- Very strong to severe shaking over broad area. Widespread structural damage.
- No deaths and few injuries due to evacuations, cordons, and risk awareness from strong earthquakes in previous four days.
