*Open311 is not a product  
nor is it a specific piece of software*

# *Open311 is a specification*

*When people say “Open311” they’re talking about the technical specification - or instances where tools implement the specification.*

*The technical specification for the Open311 GeoReport v2 API is [http://wiki.open311.org/GeoReport\\_v2](http://wiki.open311.org/GeoReport_v2)*

## GET Service List

Purpose	provide a list of acceptable 311 service request types and their associated service codes. These request types can be unique to the city/jurisdiction.
URL	https://[API endpoint]/services [format]
Sample URL	https://api.city.gov/dev/v2/services.xml?jurisdiction_id=city.gov
Formats	XML (JSON available if denoted by <a href="#">Service Discovery</a> )
HTTP Method	GET
Requires API Key	No

## Required Arguments

Field Name	Description	Notes & Requirements
<code>jurisdiction_id</code>		This is only required if the endpoint serves multiple jurisdictions

## Response

Field Name	Description	Notes & Requirements
<code>services</code>		
<code>service</code>		
<code>service_code</code>	The unique identifier for the service request type	

# *Open311* is a protocol

This particular kind of protocol is a web API  
(*Application Programming Interface*)

Specifically, the Open311 GeoReport v2 API is a web-based API that allows different applications to both view and create 311 service requests.

# *Open311* is a standard

Just as with other standardized technologies like the web or email, Open311 is a technical standard that many different products and services can implement.

If they comply with the standard, the tools are interoperable and can be used interchangeably.

*Open?*

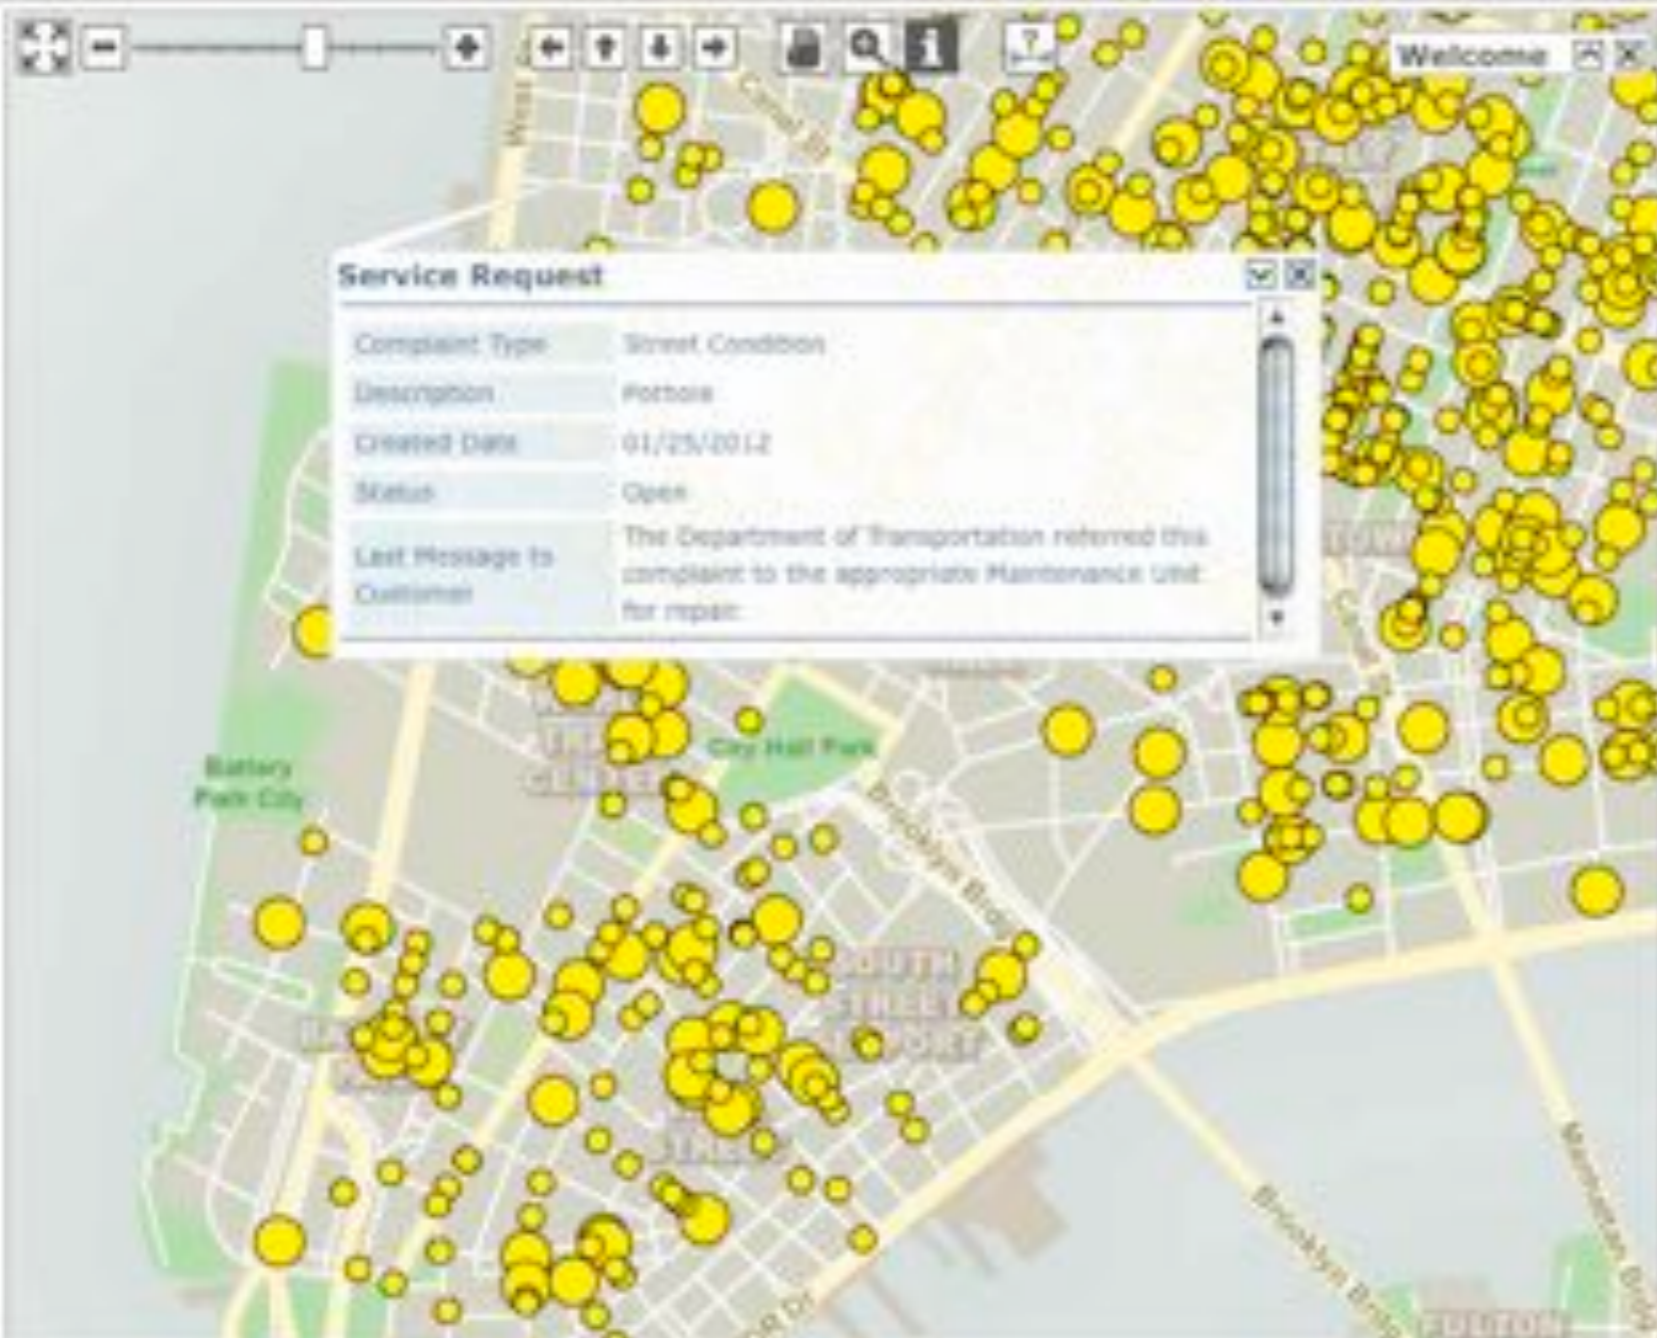

# *“Open” is used to mean 2 things:*

1. Open311 encourages 311 data to be open to the public.
2. Open311 is an open standard so anyone is free to use it and implement it without licenses, permission, fees, etc

*What is "open" 311 data like?*

## Potholes and Water

Reported in the Potholes category by Andy Griffiths at 17:42 today

Sent to Stirling Council 2 minutes later

There are several potholes at the junction of Milndavie road and Old Mugdock road on the east side of the junction. There is also water ponding across the road from the field which in cold weather freezes and is a serious hazard:

# *Reinventing the Wheel*

Should everyone have a custom app? Or just different branding?

**Boston**

**NYC**

**Portland**

**Pittsburgh**

# *Problems with proliferation*

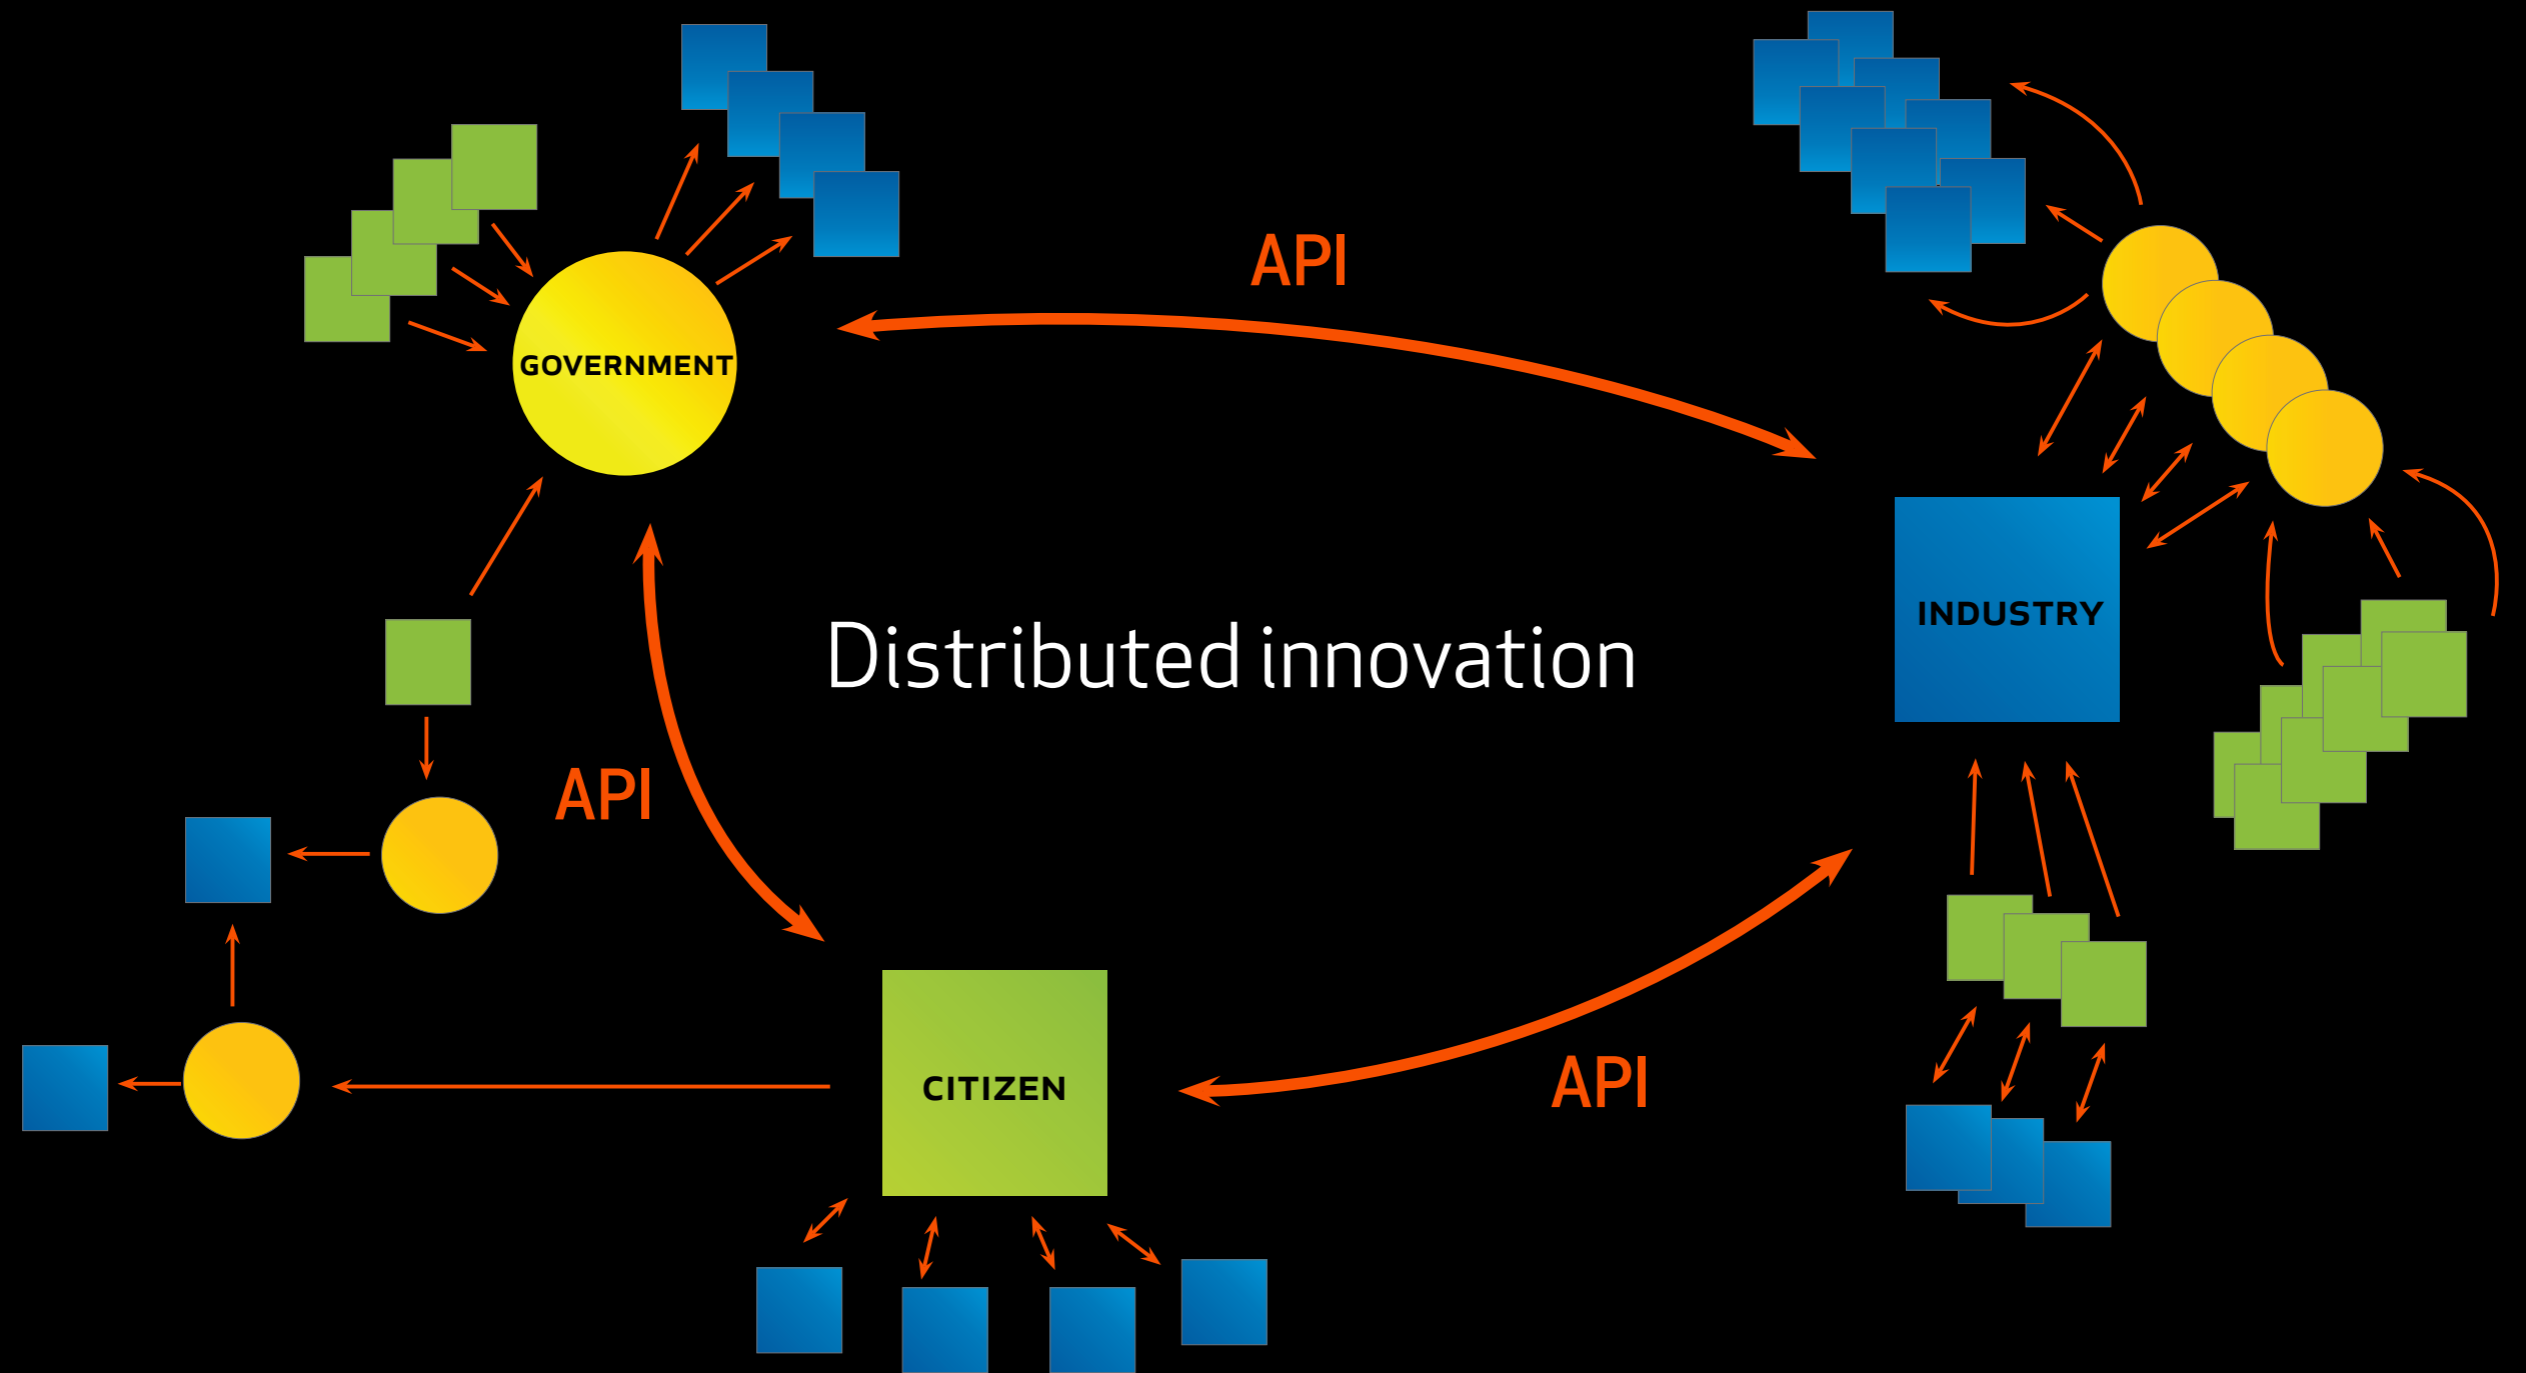

- Governments can't easily manage or control all these different apps and communication channels.
- People don't always have clear expectations set for whether government can respond or act.
- Many apps aren't actually connected to the official government CRMs.
- Most apps aren't compatible with one another and everyone has a different app.

# *Benefits of a web API*

- **Governments can control which apps connect and how they are used.**
- **Governments can provide automated responses and show SLA's where appropriate.**
- **Many different apps and communication channels can simultaneously connect to the official CRM.**
- **With many apps and services working interoperably using the same API, people and government have more choice.**

# *Benefits of an open standard*

**Interoperability**

**Consistency**

**Ubiquity**

**Efficiency**

**Shareability**

### Open 311

Subscribe

Posted by Vicki Kuntz on March 03, 2010 at 12:48 PM EST

I'm on the road today, joining San Francisco Mayor Gavin Newsom and San Francisco CIO Chris Wein for an event to highlight San Francisco's Open 311 API (Application Programming Interface) initiative. This is a great approach that ties together efforts in San Francisco, Boston, the District of Columbia, Portland, and Los Angeles to open more services to citizens, and to use data to drive progress in people's lives. Too often, people grumble that their complaints about government – be it city, county, state, or federal – get swallowed by the bureaucracy. Open 311 is an answer to that problem, placing the role of service evaluator and service dispatcher in the power of citizens' hands. Through this approach, new web applications can mash publicly available, real-time data from the cities to allow people to track the status of repairs or improvements, while also allowing them to make new requests for services. For instance, I can use the same application to report a broken parking meter when I'm home in the District of Columbia or traveling to cities like Portland, Los Angeles, Boston, or San Francisco. This is the perfect example of how government is simplifying access to citizen services. Open 311 is an innovation that will improve people's lives and make better use of taxpayer dollars.

The event which will take place at the 311 Customer Service Center in San Francisco, California will be streamed live below starting at 2:30 p.m. EST/11:30 a.m. PST.

UPDATE: This event has concluded, but you can watch it in its entirety by clicking [here](#).

# Open311 API for the mySociety FixMyStreet server

At the moment only searching for and looking at reports work.

The API implementation is work in progress and not yet stabilized. It will change without warnings in the future.

- > [Open311 initiative web page](#)
- > [Open311 specification](#)

At most 20 requests are returned in each query. The returned requests are ordered by requested\_datetime, so to get all requests, do several searches with rolling start\_date and end\_date.

The following Open311 v2 attributes are returned for each request: service\_request\_id, description, lat, long, media\_url, status, requested\_datetime, updated\_datetime, service\_code and service\_name.

In addition, the following attributes that are not part of the Open311 v2 specification are returned: agency\_sent\_datetime, file (also returned as part of description), interface\_used, comment\_count, requestor\_name (only present if requestor allowed the name to be shown on this site).

The Open311 v2 attribute agency\_responsible is used to list the administrations that received the problem report, which is not quite the way the attribute is defined in the Open311 v2 specification.

With request searches, it is also possible to search for agency\_responsible to limit the requests to those sent to a single administration. The search term is the administration ID provided by [M25](#).

Examples:

- > [discovery information](#)

# uReport Open311 CRM

uReport ("civic-crm") is a small scale, standalone, CRM web application with an Open311 (GeoReport v2) endpoint that should meet the needs of smaller municipalities wishing to deploy Open311 and/or a lightweight constituent management tool. Context-switched feeds (XML, JSON, etc) allow it to easily be integrated into existing environments. NOTE: License is really AGPL (Affers GNU General Public License) version 3. Entry currently says "GPL" only because no "AGPL" selection was available at the time this entry was created.

# Telephone & SMS Accessibility from a web API?

## Speech Enabling Open311

August 9th, 2011 by Mark Headd

Since [SpeechTEK](#) is this week, I thought it was a good time to update [a post I did several months ago](#) on using speech recognition to capture a street address.

There are lots of reasons why you might want to collect a caller's address over the phone.

In open government circles, there has been a lot of interest lately in using automated IVR systems to help gather non-emergency service requests for municipalities. This makes a lot of sense – many municipalities enable non-emergency service reporting through the use of a designated abbreviated dialing number – [3-1-1](#) – so there is a long history of reporting these issues using the telephone.

Address collection is used quite often in IVR systems, but typically relies on expensive proprietary or “black box” components that might not be suitable for all use cases. This is particularly true for municipalities and local governments who are under financial pressure and who need to do more with less.

In this post, I'll show how to build a sophisticated address collection system that can be used for almost any city or town, large or small. All of the code for this example is [on GitHub](#) (and under active development) and many of the components I will use are free or open source.

Here is a screen cast demonstrating the system running on the Tropo platform.

*“We decided for the next disaster, we can’t be a pick-up game. We have to be looking in advance what we need to develop.”*

*A good, first step would be some sort of national guidelines that describe how agencies can and should use social media to help federal agencies during presidentially declared natural disasters, Stosz said.*

***“We need to come up with some kind of required national protocol for social media for geo-tracking and locating and targeting search and rescue,” she said. “We don’t have that yet.”***

**Vice Adm. Sandra Stosz**

**The Coast Guard’s deputy commandant for mission support**

*Source: Recent hurricanes have the Coast Guard rethinking social media’s role in rescue and response.  
Nicole Ogrysko, Federal News Radio, September 21, 2017*

*Thanks!*
